A study on building greenhouse:

While aspiring to find effective ways to avoid present defects, the first phase of the project has been completed. Work is under way on:

The greenhouses are made of material that is suitable to the Sultanate's climatic conditions.

Dr al Mula elaborates on this issue by saying that because of the Sultanate's climatic conditions, there is a majority of greenhouse which is made to care for crops. This is a popular agricultural structure which was made for the use of protected agricultural, plants and vegetables and more suitable to the climatic conditions in Oman and to minimise the amount of water used, control of internal cooling and shading, has become a crucial issue for increasing crop production. In these so-called greenhouses, the farmers have better control of the amount of water used, the interior cooling system, and posts and crops types.

A workshop on the Design and Construction of Greenhouses was conducted. It included reports from the Department of Soils, Water, and Agricultural and the Agricultural and the Ministry of Agriculture in addition to internationally recognised experts to the field from Clinton and India. The workshop resulted in useful recommendations related to greenhouse design.

While searching for the best cover material to be used in a greenhouse in Phase 1 of the project, it was found that use of so-called greenhouses, which are protected agricultural plastic covered by roof and at times cooled by a system of air conditioning, has become a powerhouse of ideas and expertise to meet the pressing need for the development of effective responses and policies to assist in attaining the goals of the future of the Sultanate.

Professor Fawzi says that the HRC has already established an interdisciplinary centre to work on research projects in the humanities. It operates under the office of the HRC in various disciplines, and Research and Institutional committees, one for each centre related to the centre's research activities. The main function of the first committee is to supervise the centre's general policies and plans. These committees, their coordinator, and institutes and different institutions, are responsible for compiling and evaluating new projects, planning and executing research activities, and monitoring the research projects, and for solving problems and dilemmas while conducting research activities in the Sultanate.

In Phase 1, the project was conducted with the aim of enhancing the condensation phenomenon, and further increase in the efficiency of water production. In the coastal areas to dry in the interior regions.

Dr al Mula adds that phase 1 of the project includes both the existing agricultural structures on current design and the development of greenhouses. The first phase also focuses on the study of structure modifications, and the inclusion of agronomic research for the application of other regions with similar environmental condi-

T he Sultanate has become a powerhouse of ideas and expertise to meet the pressing need for the development of effective responses and policies to assist in attaining the goals of the Sultanate. The Sultanate, like other countries in the Arabian Peninsula, has been using greenhouses for the past 10 years to cover a total area of 42 hectares. These greenhouses, the farmer can better control the amount of water used, the interior cooling system, and posts and crop types.

The most significant function of human sciences is to help people live free from impediments of their society. This is a problem of social justice in society in their current development. Educational, administrative, educational and policy-making institutions, have a special role to play in the roots and causes of the problems that face our society. Moreover, the theories of these sciences are directly applicable to the values, ideals and positive consequences of the human sciences because they represent a structure of thought to the rising expectations of Omanis and society and to the demands of the public and private institutions. Professor Fawzi goes on to explain that the fundamental goal of the project was to create bridges of co-operation among different institutions and universities who have a special role to play in the society, and foster a positive vision of society.

The objectives of society, government, and the private sector are to strive for the enhancement of the human sciences in our society. To make a tangible and positive change in the lives of people, and to secure their future in this society.
